Project Design Phase

Proposed Solution

Date	1 March 2026
Team ID	GACSE-265
Project Name	AI Financial Advisor
Maximum Marks	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Students and young professionals often struggle with managing personal finances such as budgeting, savings planning, and investment decisions. Most financial tools are complex and require financial knowledge, while many users lack personalized guidance, leading to confusion and poor financial decision making.
2	Idea / Solution description	The proposed solution is an AI Financial Advisor that helps users manage their finances through a simple web interface. The system allows users to input income, expenses, and financial goals. Using AI models and financial calculations, the system generates personalized budgeting advice, savings plans, and investment suggestions. The application also includes a chatbot powered by the Gemini API that answers financial questions and explains financial concepts in simple language.
3	Novelty / Uniqueness	The uniqueness of this project lies in combining financial analytics, AI-based recommendations, and an interactive chatbot in a single easy-to-use platform. Unlike traditional finance apps, the system focuses on explainable AI where the user not only receives recommendations but also understands the reasoning behind financial suggestions.

4	Social Impact / Customer Satisfaction	This solution improves financial awareness among students and young professionals. By simplifying budgeting and investment planning, the system helps users build better financial habits, reduce financial stress, and make
		informed financial decisions. The chatbot also serves as a learning assistant that increases financial literacy.
5	Business Model (Revenue Model)	The platform can follow a freemium model where basic budgeting and advisory features are free, while advanced portfolio analysis, premium financial insights, and personalized investment planning can be offered as paid services. Additional revenue could come from partnerships with financial institutions or fintech platforms.
6	Scalability of the Solution	The system is designed with a modular architecture using Python, Streamlit, and APIbased AI services. It can be easily scaled by deploying it on cloud platforms such as Google Cloud or Firebase. Future upgrades may include integration with banking APIs, real-time market data, and mobile applications.
